ME-228 Digital TBC-Synchronizer for Quad VTRs.

The Merlin ME-228 is a special adaptation of Adda Corporation's VW-2 TBC-Frame Synchronizer fitted to quad VTR requirements. It provides full frame "infinite window" time base correction and an exceptional degree of transparency in either the TBC or synchronizer mode.

Providing simultaneous time base correction and synchronization, the ME-228 is capable of delaying non-synchronous video feeds by as much as a full frame to make them synchronous with system reference.

The ME-228 also supplies superior hetrodyne processing with velocity compensation in both direct and hetrodyne TBC mode.
